Abstract

The present study on marketing behaviour of randomly selected 120 coconut growers from Tiptur, Turuvekere, Chikkanayakanahalli and Sira taluks of Tumkur district was conducted during the year 2022-23. The research objective was to study the marketing behaviour of coconut growers. The findings revealed that half of the coconut growers (50.00%) in Tiptur taluk fell under the high level of marketing behaviour. Whereas significant number of coconut growers (73.33%) in Turuvekere taluk fell under the medium level of marketing behaviour. Two-fifth (40.00%) of coconut growers of Chikkanayakanahalli and more than two third (70.00%) of coconut growers of Sira taluk fell under the low level of marketing behaviour. Thus, among the overall coconut growers more than two-fifth of coconut growers (40.83%) fell under medium level of marketing behaviour followed by low level of marketing behaviour (30.83%) and then followed by high level of marketing behaviour (28.34%). The Kruskal-wallis one-way ANOVA applied to know the significant difference in the marketing behaviour of coconut growers among the taluks, showed that there is a significant difference in the marketing behaviour among coconut growers of selected taluks significant at one per cent level with H-value of 31.46.

Keywords: Coconut growers, marketing behaviour, Kruskal-Wallis one-way ANOVA, Tumkur

Introduction

Plantation crops constitute a vital segment of India's agricultural economy, significantly driving growth and development across various states. Among these crops, coconut holds particular importance, substantially to foreign exchange earnings and providing extensive direct and indirect employment opportunities, thus playing a pivotal role in socio-economic development. The coconut palm, scientifically known as Cocos nucifera, stands as the sole living species within the Cocos genus, its fruit categorized as a drupe rather than a true nut. India, boasting nearly 31% share of global coconut production (Coconut Development Board 2021) [1], stands as the world's largest producer, with the coconut palm supporting millions of farmers and providing sustenance for a significant portion of the population. Moreover, it fuels a and coconut-based coir industry, employment to hundreds of thousands.

In Karnataka, coconut cultivation thrives, with the state emerging as one of the leading producers, notably driven by Tumkur district, often referred to as 'Kalpatharu Nadu' or the 'Land of Coconuts'. This district alone contributes around 29% of the total coconut cultivation area and nearly 30% of production in the state (Coconut Development Board 2021-22) [2]. Despite its significance, the sector faces challenges, including shifts in consumer preferences and market volatility, impacting the livelihoods of coconut farmers.

In this context, agricultural extension services play a crucial role in supporting coconut farming communities by disseminating knowledge, providing technical assistance, and advocating for best practices. However, despite these efforts, there remains a need to understand and address the evolving marketing behavior of coconut growers in Tumkur district. The dynamics of market preferences and volatility necessitate a deeper exploration to develop tailored extension strategies that can enhance marketing efficiency and ensure better returns for growers, ultimately contributing to their socio-economic well-being.

This study aims to delve into the marketing behaviour of coconut growers in Tumkur district, Karnataka, with a focus on understanding the marketing behaviour of coconut growers of Tumkur district. By gaining insights into the marketing practices and challenges faced by growers, this study endeavors to guide the development institutes in formulation of targeted interventions that can optimize market participation, improve value realization, and foster sustainable socio-economic development within the coconut farming community. With this backdrop the present study has been conducted with the following specific objective to study the marketing behaviour of coconut growers.

Materials and Methods

Ex-post-facto research design was used in the present investigation. The study was conducted in the year 2022-23 in Tumkur district of Karnataka. Tumkur district was

selected purposively, because it is one of the leading coconut growing districts in Karnataka state and also coconut cultivation is being taken up in most of the taluks of the district. Tumkur district has ten taluks, out of which Tiptur, Turuvekere, Chikkanayakanahalli and Sira taluks were selected purposively considering the highest and lowest productivity. Thus, from each selected taluk, thirty coconut growers were selected by using simple random sampling. The total sample constituted from four taluks was 120 coconut growers.

Marketing behaviour refers to the behaviour of the coconut growers with respect to marketing aspects including time/period of selling coconut produce, place of sale, reasons for selling at a particular period/time, reasons for selling at a particular place, whom do they sell produce, source of acquiring market information, mode of transporting the coconut produce and selling pattern of farm produce. To know the marketing behaviour of coconut growers, the respondents were asked to indicate their responses personally by the researchers with regard to time/period of selling coconut produce, place of sale, reasons for selling at a particular period/time, reasons for selling at a particular place, whom do they sell produce, source of acquiring market information, mode of transporting the coconut produce and selling pattern of farm produce. In the present investigation procedure followed by Gulshan Ekram (2022) [3] with suitable modifications was used for the study and the coconut growers were grouped into following categories by utilizing mean and standard deviation as indicators.

| Marketing behaviour category | Criteria |
|------------------------------|---------------------------|
| Low | Less than (Mean - 1/2 SD) |
| Medium | Between (Mean ± 1/2 SD) |
| High | More than (Mean + 1/2 SD) |

Results and Discussion

Distribution of respondents with regard to Marketing behaviour

From Table 1 showing Distribution of respondents with regard to Marketing behaviour it was found that significant number of coconut growers *viz*. in Tiptur taluk (86.70%), Turuvekere taluk (93.33%) and Chikkanayakanahalli taluk (100.00%) preferred to sell their coconut produce some time after the harvest whereas half of the Sira taluk coconut growers (50.00%) preferred to sell coconut produce soon after the harvest. This might be because only Sira taluk coconut growers were preferring to sell produce in the coconut nut form whereas rest of other taluk's coconut growers were preferring to sell their produce in copra form which takes time due to drying requirement.

It was also found that coconut growers of chosen four taluks *viz.*, from Tiptur taluk (86.70%), Turuvekere taluk (80.00%), Chikkanayakanahalli taluk (100.00%) and Sira taluk (96.67%) preferred to sell their produce in the nearby city due proximity of market to their place.

Significant number of coconut growers from three taluks *viz.*, Tiptur taluk (83.33%), Turuvekere taluk (86.70%) and Chikkanayakanahalli taluk (93.33%) chose 'to fetch good price' as the main reason and significant number of coconut growers from Sira taluk (83.33%) chose 'financial urgency' as the main reason to sell their produce at a particular

period/time.

Significantly equal number of coconut growers from Tiptur taluk (93.33%) chose both 'market was very nearby to place' and 'better prices were available in the market' as the main reason. Whereas significant number of coconut growers of Turuvekere taluk (96.67%) and Sira taluk (86.67%) chose 'market was very nearby to place' as the main reason. While significant number of coconut growers of Chikkanayakanahalli taluk (93.33%) chose 'better prices were available in the market' as the main reason for selling their produce at a particular place.

Significant number of coconut growers *viz.*, from Tiptur taluk (70.00%), Turuvekere taluk (66.67%), Chikkanayakanahalli taluk (53.33%) preferred to sell their produce to the regulated markets whereas significant number of coconut growers of Sira taluk (53.33%) preferred to sell to the local traders.

In case of market information source gathering, significant number of coconut growers *viz.*, from Tiptur taluk (100.00%) gathered from the realtives and friends, while in Turuvekere taluk (96.67%) gathered from Television source, while in Chikkanayakanahalli taluk (100.00%) of them gathered information from other fellow farmers and Sira taluk (100.00%) gathered from both other fellow farmers as well as mobile phone call.

In case of mode of transporting their coconut farm produce to market, significant number of coconut growers *viz.*, from Tiptur taluk (86.67%), from Turuvekere taluk (56.66%) and from Chikkanayakanahalli taluk (93.33%) used tractor as the means of transport whereas from Sira taluk (80.00%) used auto as the means of transport.

In case of selling pattern of coconut produce, significant number of coconut growers *viz.*, from Tiptur taluk (86.67%), from Turuvekere taluk (93.33%) and from Chikkanayakanahalli taluk (100.00%) sold coconut in the form of copra while from Sira taluk (83.33%) sold produce in the form of coconuts.

Thus, among the overall coconut growers, significant number of coconut growers (75.00%) prefer to sell their produce sometime after the harvest. Significantly high number (90.83%) of coconut growers prefer to sell their produce to the market in the nearby town/city. Significant number of coconut growers (75.83%) responded that the reason for selling at that particular period/time was to fetch good price for their produce. Nearly two-third of the coconut growers (72.50%) responded that the reason for selling at a particular place was because the market was nearby to them. Significant number of coconut growers (60.00%) preferred to sell their produce to the regulated market/APMC. Significant number of coconut growers gathered market information from the mobile phone call (95.83%) as well by contacting other fellow farmers (94.17%). Significant number of coconut growers (67.50%) preferred to use tractor as a mode for carrying their produce to the market and nearly three-fourth of coconut growers (75.00%) involved in selling coconut in the form of copra.

The reasons might be the lack of marketing information which indicates many coconut growers might lack proper understanding of marketing strategies and techniques so they are not focusing on going to diverse farm produce selling pattern. They may be more focused on the production aspect of coconut cultivation rather than the

business and marketing dimension which makes them to settle for near and easily reachable markets without exploring new markets like other states and other new markets. Even price fluctuations in the coconut prices can be highly volatile due to factors like weather conditions, disease outbreaks, and global market trends. This uncertainty can discourage growers from investing in marketing efforts to explore more marketing option.

Overall Marketing behaviour of coconut growers

From Table 2, the study showed that half of the coconut growers (50.00%) in Tiptur taluk fell under the high level of marketing behaviour. Whereas significant number of coconut growers (73.33%) in Turuvekere taluk fell under the medium level of marketing behaviour. Two-fifth (40.00%) of coconut growers of Chikkanayakanahalli and more than two- third (70.00%) of coconut growers of Sira taluk fell under the low level of marketing behaviour. Thus, among the overall coconut growers more than two-fifth of

coconut growers (40.83%) fell under medium level of marketing behaviour followed by low level of marketing behaviour (30.83%) and then followed by high level of marketing behaviour (28.34%). This might be due to the low desire or lack of interest to learn and use internet or poor communication channels which can limit coconut growers ability to learn about and implement effective marketing strategies and also less effort to explore more marketing option. The findings of Chengappa (2017) [4] and Raghuraja (2001) [5] are consistent with this trend.

| Table 2: Overall N | Marketing | behaviour of | of coconut | growers | (n=120) |
|---------------------------|-----------|--------------|------------|---------|---------|

Comparison of marketing behaviour among coconut growers with Kruskal-Wallis One-way ANOVA

From the Table 3 showing the Kruskal-wallis one-way ANOVA applied to know the significant difference in the marketing behaviour among coconut growers of selected taluks, showed that there is a significant difference in the marketing behaviour among coconut growers of selected taluks with H-value of 31.46 significant at one per cent level. Where, Tiptur taluk performed better with 82.35 mean rank followed by the Turuvekere taluk with mean rank of 69.05 then Chikkanayakanahalli taluk with mean rank of 56.35 followed by the Sira taluk with mean rank of 34.25. Where it implies that as the mean rank value is more/increased the marketing behaviour is also more/increased and vice versa.

Table 3: Comparison of marketing behaviour among coconut growers with Kruskal Wallis One-way ANOVA (n=120)

| Sl. No | Taluks | Sample size | Mean rank | H-Value |
|--------|---------------------|-------------|-----------|----------|
| 1 | Tiptur | $n_1=30\\$ | 82.35 | |
| 2 | Turuvekere | $n_2=30$ | 69.05 | 31.46** |
| 3 | Chikkanayakanahalli | $n_3 = 30$ | 56.35 | 31.40*** |
| 4 | Sira | $n_4=30$ | 34.25 | |

^{**}Significant at one per cent level

Conclusion

In conclusion, the findings of this study shed light on the variations exist in the levels of marketing behaviour among coconut growers. Overall, the analysis revealed that a significant number of coconut growers fell into the medium categories of marketing behaviour, emphasizing the need for targeted interventions to enhance marketing knowledge and practices among coconut growers. This investigation also disclosed that in gathering and getting market information by coconut growers, majority of them got from mobile phone calls and contact with other fellow farmers. But some of them are lagging behind in getting information through institutional sources and social media. Therefore, there is a

need to strengthen the marketing information system. Understanding marketing behaviour are important for government officials, farmers support services and everyone involved in the coconut business. Further it will guide us that we need specific plans to help coconut farmers in different areas because their challenges and needs vary. If we understand better how farmers sell their coconuts and provide them with the right help and information, they can do better in the market. This means they can earn more money and improve their lives. It also helps to make sure that coconut farming stays strong, sustainable and evergreen in Tumkur district.
